Executive Summary

1 High-Level Overview

OVERVIEW	
Project Name	pazysalvo-ADMIN
Project Type	Frontend
Total Test Cases	58
Base URL	https://pazysalvo-vercel.vercel.app/login
Pass / Fail / Blocked	Frontend: 39 Passed / 15 Failed / 4 Blocked

2 Key Findings

Test Summary

The executable frontend subset is mostly healthy: many core navigation, dashboard, contractor, supervisor, requests, reports, and approval-list flows passed. However, the run still surfaced several meaningful user-facing regressions. The score is computed on the executable subset only and excludes 4 blocked tests. The main reliability issues cluster around profile/password management, audit navigation, request creation permissions, and handwritten signature stamping. In particular, password updates repeatedly fail with 'Ruta no encontrada.', profile fields load empty after login, the global audit route returns 404, and one key create-request flow is incorrectly denied for an Administrator. Overall, the app is usable for many flows but has important gaps in account and compliance-related journeys.

What could be better

The weakest areas are concentrated in identity, profile, and audit-related UI. Multiple password-change tests fail with the same 'Ruta no encontrada.' toast, which suggests a broken route or handler behind 'Actualizar contraseña'. The profile page renders but leaves 'Nombre completo', 'Documento', 'Correo institucional', 'Teléfono', and 'Rol' empty after login, so the user’s account data is not being populated. The audit trail page at `/auditoria` returns a 404, and the dashboard 'VER TODAS' link for recent activity sends users to `/solicitudes` instead of a dedicated activity view. Also, 'Crear solicitud' is denied for an Administrator role, indicating a permissions bug or misconfigured role policy.

Recommendations

Start by fixing the shared account/profile flows, since they cause several failures at once. Verify the password-change submit path used by the Perfil page and correct the missing or misrouted endpoint that returns 'Ruta no encontrada.' Then ensure the profile page fetches and binds the authenticated user’s data so the inputs are prefilled. Next, restore or remap the `/auditoria` route and correct the dashboard 'VER TODAS' link so it opens the intended recent-activity view. Finally, review role-based permissions for request creation so Administrador can complete 'Nueva Solicitud' if that is intended. Re-run the related tests after each fix; the titles to grep are in the `fixPrompt` panel.

Frontend UI Test Results

1 Test Coverage Summary

This report summarizes the frontend UI testing results for the application. TestSprite's AI agent automatically generated and executed tests based on the UI structure, user interaction flows, and visual components. The tests aimed to validate core functionalities, visual correctness, and responsiveness across different states.

CATEGORY	TEST CASES	PASS/FAIL RATE
Dashboard Overview	4	3 Pass / 1 Fail
Supervisor Management	5	4 Pass / 1 Fail
Requests & Contract Intake	7	6 Pass / 1 Fail
Approvals & Signatures	5	2 Pass / 1 Fail / 2 Blocked
Dependency Management	6	6 Pass / 0 Fail
Audit & Traceability	6	2 Pass / 4 Fail
Login & Password Recovery	5	3 Pass / 1 Fail / 1 Blocked
Reports	5	5 Pass / 0 Fail
Contractor Management	5	4 Pass / 1 Fail
User Management	6	4 Pass / 2 Fail
Profile & Password Change	4	0 Pass / 3 Fail / 1 Blocked

Note

The test cases were generated using real-time analysis of the application's UI hierarchy and user flows. Some visual and functional validations were adapted dynamically based on runtime DOM changes.

2 Test Execution Summary

TEST CASE	TEST DESCRIPTION	IMPACT	STATUS
Dashboard Overview			
Review recent activity status from the dashboard	Verify the dashboard recent activity feed shows activity entries with their current statuses.	Low	PASSED
Open dashboard from the main navigation	Verify a signed-in user can return to the dashboard through the main navigation and see the overview content.	Medium	PASSED
View dashboard summary counts	Verify the landing dashboard shows the main system summary metrics for a signed-in user.	High	PASSED
Open recent activity from the dashboard	Verify the user can access the full recent activity view from the dashboard overview.	Medium	FAILED

Supervisor Management			
Open supervisor management from the main navigation	Validates that an administrator can reach the supervisor management area from the application navigation and view the supervisor list.	Low	PASSED
Edit a supervisor record	Validates that an administrator can update an existing supervisor's information from the supervisor list.	High	PASSED
Search for an existing supervisor	Validates that an administrator can search and locate a supervisor record in the management list.	Medium	PASSED
Create a new supervisor	Validates that an administrator can create a supervisor record from the supervisor management area.	High	PASSED
Deactivate a supervisor record	Validates that an administrator can disable an existing supervisor from the management list.	Medium	FAILED
Requests & Contract Intake			
Return to the requests list from a request detail view	Validates that an authenticated administrator can inspect a request and return to the main requests list.	Low	PASSED
Open the signature chain for a request	Validates that an authenticated administrator can inspect the signature chain for a listed request.	High	PASSED
Review a request from the requests list	Validates that an authenticated administrator can open a request and inspect its contract intake details.	High	PASSED
Search for a request by contractor or contract	Validates that an authenticated administrator can search the requests list and see matching results only.	High	PASSED
Inspect a rejected request from the requests list	Validates that an authenticated administrator can locate and inspect a rejected Paz y Salvo request.	Medium	PASSED
Inspect a signed request from the requests list	Validates that an authenticated administrator can locate and inspect a signed Paz y Salvo request.	Medium	PASSED
Create a new contract request	Validates that an authenticated administrator can create a new Paz y Salvo request from the requests area.	High	FAILED
Approvals & Signatures			
Switch between pending approvals and signature history	Validates that a user can move from the pending approvals list to the signature history view and return to the pending list.	Medium	PASSED
Review an approval and stamp the signature in PDF	Validates that a pending request can be signed and finalized specifically through the PDF stamping path.	High	BLOCKED
Open a signed request from the approvals list	Validates that a completed request can be opened from the approvals and signatures area for review.	Medium	PASSED
Upload a signature image and stamp the document	Validates that a user can upload a signature image for a pending approval and complete the signing process.	High	BLOCKED
Review a pending approval and stamp a handwritten signature	Validates that a pending request can be opened from the approvals list, signed with a handwritten signature, and confirmed successfully.	High	FAILED

Dependency Management			
Cancel dependency edit	Verify the administrator can open a dependency for editing and exit without applying changes.	Low	PASSED
View dependencies list	Verify the administrator can open the dependencies management page and see the organizational dependency listing.	High	PASSED
Search for a dependency	Verify the administrator can search within dependencies and see matching results in the list.	High	PASSED
Edit a dependency and save changes	Verify the administrator can open a dependency for editing, update its details, and save the changes.	High	PASSED
Change dependency status	Verify the administrator can edit an existing dependency and change its active state.	Medium	PASSED
Create a new dependency	Verify the administrator can open the dependency creation flow, enter details, and save a new dependency.	Medium	PASSED
Audit & Traceability			
View recent activity from dashboard	Verify the administrator can access the dashboard and review recent activity as part of traceability oversight.	Medium	PASSED
Audit trail shows traceable administrative events	Verify the administrator can review traceability records that include key administrative actions.	High	PASSED
Access profile data after login	Verify the administrator can open the profile page and review their loaded account information.	Medium	FAILED
Change password from profile	Verify the administrator can change their password successfully from the profile page.	High	FAILED
View global audit trail	Verify the administrator can open the audit area and see the system action history.	High	FAILED
Recover password from login	Verify the administrator can request password recovery and reach the recovery flow from the login screen.	Low	FAILED
Login & Password Recovery			
Open password recovery from login	Validates that a user can move from the login page to the password recovery page through the recovery entry point.	High	BLOCKED
Return to login from password recovery	Validates that a user can navigate back to the login page from the password recovery screen.	Medium	PASSED
Request a password recovery link	Validates that a user can submit their institutional email from the recovery page to request password reset instructions.	High	PASSED
Log in with institutional credentials	Validates that an institutional user can sign in successfully from the login page and reach the authenticated area.	High	PASSED
Change password from the profile page	Validates that an authenticated user can update their password from the profile page.	High	FAILED

Reports			
Switch from reports to requests list	Validates that a logged-in administrator can move from the reports overview to the solicitudes management view through navigation.	Medium	PASSED
View report summary cards	Validates that the reports page shows the key contract summary metrics for the logged-in administrator.	High	PASSED
Review contracts by status	Validates that the reports page presents a status breakdown for contracts with multiple states.	High	PASSED
Open the reports area from the dashboard	Validates that a logged-in administrator can access the reports view from the main application navigation.	Medium	PASSED
Refresh the reports overview	Validates that the reports page can be reloaded while preserving access to the reporting summary view.	Low	PASSED
Contractor Management			
Search contractors	Verify the administrator can search for a contractor and see matching results.	High	PASSED
Create contractor	Verify the administrator can open the new contractor flow and complete contractor creation.	High	PASSED
View contractor list	Verify the administrator can open the contractors section and see the contractor listing.	High	PASSED
Edit contractor	Verify the administrator can update an existing contractor's information.	Medium	FAILED
Deactivate contractor	Verify the administrator can deactivate an existing contractor from the contractor list.	Medium	PASSED
User Management			
Admin logs in and opens user management	Validates that an administrator can log in and reach the user management area.	High	PASSED
Create a supervisor user	Validates that an administrator can create a new supervisor account from the user management page.	High	PASSED
Navigate to profile and update password	Validates that an administrator can open their profile and update their password successfully.	High	FAILED
Open a user record for editing	Validates that an administrator can open an existing user record from the user list.	Medium	PASSED
Search for an existing user	Validates that an administrator can find a user by searching the user list.	Medium	PASSED
Open the password recovery page from login	Validates that the password recovery flow is reachable from the login screen.	Low	FAILED
Profile & Password Change			
Update password from profile page	Validates that an authenticated user can change their password from the profile page using the current password and matching new password values.	High	FAILED
View profile details after login	Validates that an authenticated user can open the profile page and see their personal information populated.	High	FAILED
Recover password from login page	Validates that a user can open the recovery page from login and request a password reset link using their institutional email.	Medium	FAILED
Return from recovery page to login	Validates that a user can navigate back from the password recovery page to the login page.	Low	BLOCKED

3 Test Execution Breakdown

Failed & Blocked Test Details

Open password recovery from login

ATTRIBUTES

Status	BLOCKED
Priority	High
Description	Validates that a user can move from the login page to the password recovery page through the recovery entry point.

Error

TEST BLOCKED The password recovery page could not be reached — the site is unreachable due to a DNS/network error. Observations: - The browser shows "This site can’t be reached" with error DNS_PROBE_FINISHED_NXDOMAIN for pazysalvo-vercel.app. - The recovery URL https://pazysalvo-vercel.vercel.app/recuperar could not be loaded; no recovery heading or institutional email input was visible to verify the feature.

Cause

The failure is most likely on the hosting/DNS side: the domain pazysalvo-vercel.app is resolving to NXDOMAIN, which indicates the hostname does not exist in DNS or is not currently delegated/attached to the deployment. This can happen if the domain was mistyped, removed from the project, not verified, or the DNS records were never created or have expired, making the app unreachable before the route-level test could run.

Fix

Verify that the custom domain pazysalvo-vercel.app is correctly provisioned in the hosting platform (DNS records, domain verification, and assignment to the deployment). If it is meant to be a Vercel subdomain, confirm the production alias exists and points to the active deployment; if it is a custom domain, add/repair the required CNAME/A records and ensure the apex/www configuration is correct. After correcting DNS and redeploying or reassigning the domain, confirm that /login and /recuperar route to the app and that the recovery page is accessible.

Update password from profile page

Error

TEST FAILURE The password change flow did not complete successfully — submitting the current password with a valid matching new password produced an error instead of a confirmation. Observations: - The page displayed a red error toast reading 'Ruta no encontrada.' immediately after clicking 'Actualizar contraseña'. - No success confirmation (for example 'Contraseña actualizada' or a green/success toast) appeared after submission. - The change-password form remained on-screen with no indication that the password was updated.

Cause

The deployed service likely has a routing mismatch for the password-change request, causing the submission to reach a non-existent route on the hosting platform and return a 404 ('Ruta no encontrada.') instead of processing the password update. This can happen if the frontend is pointing to an incorrect endpoint, the API route was not deployed, or Vercel rewrites/serverless function configuration is missing or incorrect for production.

Fix

Check the password-update action on the hosting/deployed app and make sure the frontend is calling the correct backend route for this environment. The 'Ruta no encontrada.' toast suggests the submit is hitting a missing/incorrect endpoint (often due to a bad relative URL, mismatched API base URL, or an SPA rewrite/config issue on Vercel). Verify the password change API route exists in the deployed build, is included in production routing, and that any proxy/rewrite rules forward the request to the intended serverless function or backend. Also confirm the form submission handler uses the correct HTTP method and path expected by the backend.

Error

TEST FAILURE Password update did not succeed — the application returned an error instead of a success confirmation when attempting to change the administrator's password. Observations: - After submitting the password change via the 'Actualizar contraseña' button, a notification with the message 'Ruta no encontrada.' was displayed. - No success message such as 'Contraseña actualizada' was found on the Perfil page. - The Perfil page remained accessible: the header 'Perfil de Usuario' and the password form are still visible after the attempt. Checklist against the test steps in the task: - Navigate to login page: completed. - Login as admin@institucion.edu.co with AdminSeguro123!: completed and confirmed. - Open Profile: completed and confirmed. - Fill current and new passwords and submit: completed (attempt reproduced). - ASSERTION — confirmation visible: FAILED (no success message; observed error 'Ruta no encontrada.'). - ASSERTION — profile remains accessible: PASSED (profile header and fields remain visible). Conclusion and recommendation: - The password update flow is broken at the server/API routing layer (response: 'Ruta no encontrada.'), so the feature does not complete successfully. This is a failing test: the application should return a success confirmation when the password is changed but instead returns a route-not-found error. Developers should investigate the backend route handling for the password update endpoint. Evidence sources: current Perfil page DOM and the notification message visible after clicking 'Actualizar contraseña' (page screenshot and search results captured during this session).

Cause

The password update request is reaching a non-existent or incorrectly mapped route on the hosted application, so the backend returns a 404 'Ruta no encontrada.' instead of processing the change. This is likely due to a missing deployed serverless function, a bad rewrite/rewrite mismatch, an incorrect endpoint URL in the frontend, or a method/path mismatch between the Perfil form and the hosting configuration.

Fix

Verify the password-change API endpoint that the Perfil page calls and ensure it is actually deployed on Vercel under the expected path. If the frontend is posting to a relative route (e.g. /api/… or /perfil/cambiar-contraseña), add/update the matching serverless function or rewrite rule in vercel.json so the request is routed correctly. Also confirm the endpoint handles the method used by the form (typically POST/PATCH) and returns a success response on valid credentials. If this used to work locally but fails only on hosting, check for missing API files in the deployed build, incorrect route casing/naming, or a basePath/rewrites mismatch causing Vercel to return 404 'Ruta no encontrada.'

Review an approval and stamp the signature in PDF

Error

TEST BLOCKED The test could not be run — the signing action requires supplying a signature image or drawing a signature, and the required input could not be provided in this test environment. Observations: - The 'Estampar Firma Manuscrita' modal is open and shows controls for paste, upload, draw, and a 'Confirmar y Estampar en PDF' button. - No signature file was provided for upload in this test run (no available files for upload were listed), so the 'Subir Imagen' path cannot be executed. - Drawing a signature or pasting an image cannot be reliably simulated with the automated action primitives available in this environment, so the handwritten-signature alternative cannot be completed.

Cause

The hosting-side failure is likely that the app requires a manual signature image/drawing step that cannot be completed in the automated environment. In practice this can be caused by the signature component depending on client-only pointer/canvas interactions, missing or inaccessible upload assets in the deployed environment, or the upload/signature capture control being unavailable due to a runtime/configuration issue. As a result, the test gets blocked because there is no machine-provided signature source the service can accept in this flow.

Fix

Make the signing flow automatable and robust by ensuring the handwritten-signature modal accepts a default/test signature input path. For example: provide a preloaded sample signature file in the test environment, allow a URL/base64 signature to be injected via a query param or API field, add a server-side fallback for empty signature input in non-production/test mode, and verify the upload endpoint works without requiring manual paste/draw interaction. Also confirm the modal's upload control is present, enabled, and not blocked by CORS/permissions, and that the PDF stamping action can proceed when a signature image is supplied.

Error

TEST FAILURE The profile page is reachable but the administrator's account details are not loaded into the form fields. Observations: - The Perfil (Profile) page opened successfully and the fields for Nombre completo, Documento, Correo institucional, Teléfono, and Rol are visible. - Each of those input fields has an empty value attribute (value=""), indicating the account data is not populated in the UI. - The app allowed login and navigation to Perfil, but the expected administrator information is not shown in the profile form. Details observed during this session: - URL visited: https://pazysalvo-vercel.vercel.app/perfil - Inputs located with aria-labels: "Nombre completo", "Documento", "Correo institucional", "Teléfono", "Rol" — all returned value="" in the DOM. Result: The feature is reachable but behaves incorrectly because the administrator's profile data is not displayed; therefore the test fails (success=false).

Cause

The most likely hosting-side issue is that the deployed frontend cannot retrieve the administrator profile data in production, even though navigation succeeds. This can happen when the API URL or required environment variables are missing/misconfigured on Vercel, or when the session/auth cookie is not being forwarded to the profile request due to domain/CORS/SameSite settings. As a result, the perfil form renders but receives no data and all fields remain empty.

Fix

Check the hosting/runtime configuration for the perfil page so it can fetch or hydrate the authenticated admin profile data correctly in production. Verify that the API base URL and environment variables used to load the user profile are set in Vercel, that the backend/profile endpoint is reachable from the deployed site, and that authentication cookies/tokens are being sent cross-origin if required (proper domain, SameSite, Secure, CORS, and credentials settings). Also confirm the profile page is not relying only on client-side state that is never initialized after login; if needed, fetch the admin record on page load using the authenticated session and bind the response to the form fields. Finally, inspect production logs for failed profile requests or auth mismatches and redeploy after correcting any env vars, request paths, or session handling.

```

Error

TEST FAILURE The profile page did not display the user's personal information after successful login. Observations: - The profile inputs for Nombre completo, Documento, Correo institucional, and Teléfono are present but empty on the Perfil page. - The Rol input on the Perfil page is empty, even though the application header shows "Administrador General". Details: - Login and navigation succeeded (user admin@institucion.edu.co). The Perfil page was reached and inputs were inspected; their values are empty (value=""). Result: The requirement that an authenticated user's personal information and account role be displayed on the profile page is not met. Marking the test as FAIL.

Cause

The most likely cause is a production data-loading/session propagation issue: the login succeeds, but the profile page does not receive or request the authenticated user's personal information, so the controlled inputs remain empty. This can happen if the hosting environment has misconfigured API URLs, missing auth cookies/headers, failed SSR data fetching, or a broken state transfer between login and profile navigation. The mismatch where the header shows 'Administrador General' but the role input is empty suggests the role is available in one part of the app state but not passed into the profile form or not fetched from the backend for that page.

Fix

The profile page is likely rendering before user profile data is fetched or hydrated, or it is only reading from client-side state/localStorage that is not being populated after login. On the hosting/deployment side, verify that the authenticated session/JWT is available to the profile route, that the backend endpoint returning user details and role is reachable in production, and that environment variables/API base URLs are correctly configured. If the app uses SSR/Next.js, ensure the profile page fetches the user identity server-side or refetches on mount and maps the returned fields to the inputs' value props (including role). Also check that production data for the admin account actually includes those fields and that CORS/cookie settings allow the session to persist across navigation.

Upload a signature image and stamp the document

Error

TEST BLOCKED A required upload file was not provided for this test run — the test could not be completed. Observations: - The "Estampar Firma Manuscrita" dialog is open and displays an image upload control and the 'Subir Imagen' option, plus the 'Confirmar y Estampar en PDF' button. - No uploadable signature image file was available in the test environment, so the upload step cannot be performed.

Cause

The hosting/test environment is exposing a required manual file-upload step (‘Subir Imagen’) with no available signature image fixture attached to the run. As a result, the workflow is blocked because the application or test setup expects a local image file to be uploaded, but the hosted environment does not provide one. This is likely a test data/configuration issue on the hosting side rather than a UI rendering failure.

Fix

Ensure the signature-stamping flow does not depend on an externally supplied local file in automated/hosted runs. Provide a default sample signature asset or a built-in fallback (e.g., draw/text signature option), and make the upload control accept server-hosted test fixtures or pre-seeded files. If the service is intended for automation, add a way to bypass the manual upload step (preloaded example image, signed URL, or test mode with mock signature data) so the dialog can proceed without user-provided files.

Error

TEST FAILURE The password change did not succeed — the application returned an error after submitting the form. Observations: - After clicking 'Actualizar contraseña', a red toast with the message 'Ruta no encontrada.' appeared. - No success confirmation (e.g., a green 'password updated' toast) was observed on the Perfil page. - There is no UI evidence that a new session token was issued; token issuance could not be verified via the visible UI.

Cause

La causa más probable es que el submit del cambio de contraseña está apuntando a un endpoint inexistente en producción, por lo que el hosting responde 404 y el frontend muestra el toast de "Ruta no encontrada.". Esto suele ocurrir por una ruta mal configurada entre frontend y backend, una API route no incluida en el build/deploy, o una diferencia entre rutas locales y rutas publicadas en Vercel (por ejemplo, path hardcoded, basePath incorrecto o rewrite faltante).

Fix

Revisar la configuración de rutas y despliegue en Vercel para el endpoint que procesa el cambio de contraseña. El error "Ruta no encontrada" indica que el formulario está enviando la petición a una URL inexistente o que la API route no está siendo desplegada/matcheada correctamente en producción. Verificar que exista la ruta backend correspondiente (por ejemplo /api/... o la ruta de server action), que el método HTTP esperado sea el correcto, que el path usado por el frontend coincida exactamente con el handler real, y que las variables de entorno/base URL apunten al dominio correcto. Si es una SPA con reescrituras, añadir una rewrite/fallback apropiada; si es una API en Vercel, confirmar que el archivo de endpoint esté en la ubicación correcta y exporte el método adecuado. Además, revisar logs de Vercel para detectar si el request cae en 404 por un cambio reciente de nombre/ruta o por un build fallido.

Change password from the profile page

```

Error

TEST FAILURE The password update did not succeed — a transient error prevented completion and no success confirmation was shown. Observations: - After submitting the new password, a red toast with the message 'Ruta no encontrada.' was shown (error observed immediately after clicking 'Actualizar contraseña'). - The Perfil de Usuario page remained accessible and the password fields were still displayed (the UI did not navigate away or show a success confirmation). Conclusion: The change-password action failed due to an error response from the application. The profile page itself remains accessible, but the password update did not complete successfully.

Cause

The hosting environment is returning a 404-style response for the password-change submission endpoint, causing the app to show 'Ruta no encontrada.' This usually means the deployed service is missing the backend route/function, or the host’s rewrite rules are not forwarding the request to the correct handler. In short, the password update request is being sent to a path that does not exist or is not reachable in production.

Fix

Verify the hosting/rewrite configuration for the password update endpoint used by the form (the route invoked by 'Actualizar contraseña'). The red toast 'Ruta no encontrada.' indicates the request is reaching the deployed app but the target path/API handler is missing or not being routed correctly. Fix by restoring the missing route or API function on the host, and ensure any framework rewrites/redirects (e.g. SPA fallback or /api/* mapping) are correctly configured in the deployment. Also confirm the production environment variables and backend URL for auth/password-change are correct, then redeploy. If the route exists in code, check for a mismatch between client-side path and deployed server path (case sensitivity, basePath, trailing slash, or versioned endpoint).

Review a pending approval and stamp a handwritten signature

Error

TEST FAILURE The signature stamping did not complete successfully — the UI returned an error and the stamped PDF view was not shown. Observations: - A red toast displayed: "No se pudo estampar la firma." immediately after confirming the signature. - No stamped PDF view opened or became visible after confirmation (no evidence of a stamped document in the modal or page). - The request still shows status "Estado: Pendiente" on the approvals page, so the approval/signature is not reflected.

Cause

Lo más probable es un fallo en el backend durante la generación o guardado del PDF estampado, no en la UI: el servidor está devolviendo un error al confirmar la firma, por lo que la app muestra ‘No se pudo estampar la firma’. En hosting tipo Vercel esto suele ocurrir por uso de filesystem local para guardar/leer el PDF, variables de entorno/credenciales de almacenamiento ausentes o inválidas, timeout en una función serverless, o un error al actualizar la aprobación en la base de datos después de la estampación, dejando el estado en ‘Pendiente’.

Fix

Revisar el flujo de estampado en el backend y en la integración de almacenamiento/renderizado: validar que el endpoint que firma/estampa el PDF esté recibiendo correctamente el archivo y los datos de la firma, que la cuenta/credenciales de storage no estén fallando en Vercel, y que el servicio no esté dependiendo de filesystem local o rutas temporales no soportadas en hosting serverless. Verificar logs del endpoint de estampado, permisos CORS/auth, tamaño/formato del PDF, y que al completar la operación se persista el cambio de estado a ‘Aprobado/Firmado’ antes de responder. Si el proceso usa librerías nativas o generación pesada de PDF, moverlo a una función/server dedicado o adaptar a un entorno serverless compatible.

Error

TEST FAILURE Creating a new Paz y Salvo request as an Administrator was not permitted — the application returned an access denied error when submitting the form. Observations: - The 'Nueva Solicitud' form was completed and the 'Registrar Solicitud' button was clicked. - A red toast appeared: 'Error al registrar solicitud: Acceso denegado. Tu rol (Administrador) no tiene permisos para esta acción.' - No success toast or new entry in the solicitudes list was created after submission.

Cause

The hosting-side service is likely enforcing a production authorization rule that does not recognize the Administrator account as permitted to create solicitudes. This can happen if the backend role-based access control is misconfigured, the production environment variables/JWT claims are incorrect, or the deployed API is using a stale/incorrect permissions mapping, causing the server to return 'Acceso denegado' even though the UI is accessible and the form submits correctly.

Fix

Revisar la autorización en el backend/hosting for the solicitud creation endpoint: ensure the production environment recognizes the logged-in Administrator role, the JWT/session carries the correct role claim, and the server-side RBAC/ACL for creating 'Nueva Solicitud' includes Administrador. Check Vercel env vars, auth middleware, and any role mappings or database permissions that may differ in production versus local. If the role name is mismatched (e.g., 'Administrador' vs 'admin') or the claim is missing/overwritten, update the auth logic and redeploy so administrators are allowed to submit solicitudes.

Edit contractor

ATTRIBUTES

Status	FAILED
Priority	Medium
Description	Verify the administrator can update an existing contractor's information.

Error

TEST FAILURE The update action persisted but the required visible confirmation message was not observed. Observations: - The contractors list shows the updated record: 'Updated Contractor' with email 'updated.contractor@example.com'. - No visible success confirmation toast or message (searches for 'Contratista actualizado correctamente.' and related keywords returned no matches). - The absence of a visible confirmation message means the test assertion requiring a confirmation is not met, even though the updated data appears in the list.

Cause

The update mutation is persisting correctly, but the hosting-side production behavior is not rendering the visible success confirmation. This is commonly caused by the toast/alert component not being mounted in the deployed app, a production-only regression in client-side notification logic, the success message being swallowed by navigation/re-rendering immediately after save, or a localization/text mismatch so the expected message is never shown. Since the record updates in the list, the backend action likely succeeds; the failure is in the UI confirmation layer on the hosted build.

Fix

Ensure the update flow triggers a visible, non-auto-hidden success toast/message after the contractor save request resolves. Verify the client-side success callback is executed in the production build, that the toast provider/container is mounted on the page, and that the success text matches the expected locale string ('Contratista actualizado correctamente.'). If the app relies on SSR/client hydration or a different notification library, confirm it is not being blocked by missing CSS, z-index issues, or route-level component unmounting. Also verify the backend returns a success response that the frontend uses to render the confirmation, and add an end-to-end check for the toast in production/staging.

    asyncio.run(run_test())

```

Error

TEST FAILURE The audit area could not be reached — navigating to the audit page returned a 404 and the audit trail or action-history could not be verified. Observations: - Navigated to https://pazysalvo-vercel.vercel.app/auditoria and the page shows '404' with the message 'Oops. Nothing here...'. - No audit trail UI or action-history entries are visible; only a 'Go Home' link is present on the page.

Cause

The hosting setup is missing or misconfigured for the audit page route. The most likely issue is that '/auditoria' does not exist in the deployed build, was renamed/removed, or the framework/Vercel routing is not mapping that URL to the audit page. As a result, direct navigation returns Vercel's 404 page, so the audit trail UI cannot be reached or verified.

Fix

Ensure the audit route is actually deployed and routed on Vercel. Add/restore the '/auditoria' page or API endpoint in the app, verify file-based routing matches that path, and if using client-side routing/rewrites, configure a Vercel rewrite so direct visits to '/auditoria' resolve to the audit page instead of a 404. Then redeploy and confirm the audit UI/action history loads from the correct backend source.

Error

TEST FAILURE The deactivation action was accepted by the UI, but the supervisor row cannot be found to verify the required post-condition that it remains visible and is marked inactive. Observations: - The UI displayed the toast 'Supervisor desactivado correctamente.' after confirming deactivation. - Searching for '65894881' returned 'No se encontraron coincidencias', and clearing the search shows the full list (1–12 of 12) which does not include documento 65894881. - The supervisor with documento 65894881 is not listed on the Supervisores page, so the assertions that the supervisor remains visible and shows an inactive indicator cannot be verified.

Cause

The supervisor with documento 65894881 disappears from the Supervisores page after deactivation because the hosted service is likely treating deactivation as a removal/archival action instead of a status change, or the list endpoint is excluding inactive records. As a result, the UI cannot display the same row with an inactive state, which causes the test to fail even though the toast confirms the action succeeded.

Fix

On the hosting/service side, the most likely issue is that the deactivation flow is removing the supervisor from the active list or the API query used by the Supervisores page is filtering inactive records out entirely. Fix the backend/frontend contract so deactivation only toggles an 'inactive' status (e.g., activo=false or estado='INACTIVO') without deleting the record, and ensure the Supervisores listing endpoint/page includes inactive supervisors as visible rows with an inactive badge/indicator. Also verify any search/filter/sort logic and caching on the hosted environment so the deactivated supervisor still appears after refresh and is returned by the list query.

Error

TEST FAILURE Clicking the password recovery link did not open the recovery flow — the recovery screen was not reached. Observations: - The login form (role selector, 'Correo o Documento de Identidad *' and 'Contraseña *' inputs and 'Iniciar sesión' button) remains visible after repeated click attempts on '¿Olvidó su contraseña?'. - The '¿Olvidó su contraseña?' link is present on the page, but activating it (multiple attempts) did not navigate to or reveal any recovery form or confirmation UI. - Because the recovery flow UI could not be reached, it was not possible to fill admin@institucion.edu.co, submit a recovery request, or verify a confirmation message.

Cause

The most likely hosting-side cause is that the deployed production build is missing or breaking the password-recovery navigation logic. This can happen if the recovery link points to a route that is not served correctly on the host, if client-side routing fallback is misconfigured, if a recent deployment omitted the recovery component or handler, or if runtime configuration/env vars required to render the recovery flow are absent. As a result, clicking '¿Olvidó su contraseña?' leaves the login UI unchanged because the app never transitions to the recovery state.

Fix

Verify that the password-recovery link is wired to an actual route or state transition in the deployed build. If it is supposed to open a modal or switch panels, ensure the click handler is present in production, not blocked by an overlay, and not prevented by CSS/JS issues. Check the hosting deployment for broken client-side routing (e.g., missing route, base path mismatch, or 404 fallback misconfiguration), and confirm the recovery page/component is included in the production bundle. If using auth-provider recovery, validate environment variables and API endpoints so the recovery screen can render and submit successfully.

154     asyncio.run(run_test())
155
```

Error

TEST FAILURE The Dashboard 'Ver todas' link does not open a dedicated full recent activity view — it navigates to the Solicitudes (requests) list instead. Observations: - The 'Actividad Reciente' panel is present and shows multiple recent activity items in-place on the Dashboard. - The 'VER TODAS' link's href points to https://pazysalvo-vercel.vercel.app/solicitudes and clicking the link navigated to the Solicitudes list instead of a separate recent-activity view. - Multiple attempts to click the 'VER TODAS' link reproduced the same behavior (no separate full recent activity page was displayed). Conclusion: The expected feature (a dedicated "full recent activity" view accessible from Dashboard → 'Ver todas') is not available or is mislinked; the link goes to Solicitudes. Marking the test as failed.

Cause

The hosted site appears to have a misconfigured or outdated link in the Dashboard's 'Actividad Reciente' section. The 'Ver todas' action is currently hardcoded or routed to /solicitudes, which is the requests list, rather than a dedicated full recent-activity page. This is likely a frontend routing/content issue in the deployed build (or a stale deployment) rather than an API/runtime failure.

Fix

Update the Dashboard 'VER TODAS' link to point to a dedicated recent-activity route/page (for example, /actividad or /dashboard/actividad) instead of /solicitudes. Verify the frontend router and deployed build include the correct href/navigation target, then redeploy. If the intended page does not exist, create it and wire the Dashboard link to that new view.

Error

TEST FAILURE The password recovery flow could not be reached from the login screen — attempts to open the recovery page did not display a recovery form or email input. Observations: - The login page contains an anchor labeled '¿Olvidó su contraseña?' with href 'https://pazysalvo-vercel.vercel.app/recuperar'. - Navigating to /recuperar (clicked, direct navigate, and opened in a new tab) left the UI showing the login form; no 'Recuperar' header or recovery email input was found. - The page's interactive elements include only the login inputs (Correo o Documento de Identidad, Contraseña) and the '¿Olvidó su contraseña?' link; no recovery email field is present.

Cause

The hosting/deployment is likely serving the login page for the /recuperar URL because the recovery route is missing, misrouted, or rewritten incorrectly on Vercel. A common cause is a broken route build artifact, an absent static page for /recuperar, or a catch-all fallback that sends unknown paths to the login screen. Another possibility is that the recovery form exists in code but is not included in the production build/hydration, so the route never swaps away from the login UI when /recuperar is visited.

Fix

Make /recuperar resolve to a real recovery route/page on the deployed app. In a Next/Vercel setup, this usually means adding the missing route file (e.g. app/recuperar/page.tsx or pages/recuperar.tsx), ensuring it renders a recovery form with an email input and a visible 'Recuperar' heading, and verifying client-side routing/hydration so the page content is not falling back to the login screen. Also check Vercel rewrites/redirects so /recuperar is not being redirected to /login or served the login route by mistake. If this is an SPA, update the router config so the recovery path is recognized and deployed correctly, then redeploy and confirm direct navigation to /recuperar returns the recovery UI.

Recover password from login page

ATTRIBUTES

Status	FAILED
Priority	Medium
Description	Validates that a user can open the recovery page from login and request a password reset link using their institutional email.

Error

TEST FAILURE The password recovery flow could not be reached from the login page: clicking the '¿Olvidó su contraseña?' link and navigating to /recuperar did not display any recovery form or confirmation, despite selecting the 'Administrador' role beforehand. Observations: - Clicking '¿Olvidó su contraseña?' (visible on the login form) left the login form displayed with no change. - Direct navigation to https://pazysalvo-vercel.vercel.app/recuperar did not display a recovery form; the UI remained on the login page.

Cause

The most likely hosting-side issue is that the /recuperar path is not being served by the deployed application—either the route is missing from the build, not registered in the router, or Vercel is not configured to rewrite direct requests to the client app. A secondary possibility is that the link click is bound to a handler that does nothing in production because the recovery page/component is conditionally hidden behind role/auth logic, so selecting 'Administrador' still leaves the app on the login view instead of switching to the recovery view.

Fix

Verify that the /recuperar route exists in the deployed app and is included in the client-side/router config for all roles, including Administrador. If using role-based UI gating, ensure the password-recovery link navigates to an actual route or modal state instead of a no-op. On the hosting side, confirm Vercel rewrites/fallbacks are configured so direct hits to /recuperar are served by the SPA entrypoint, and redeploy after fixing any missing route chunk or build output. If the app relies on auth state/role in local storage, make sure the recovery page does not require an active session or selected role to render.

Return from recovery page to login

ATTRIBUTES

Status	BLOCKED
Priority	Low
Description	Validates that a user can navigate back from the password recovery page to the login page.

Error

TEST BLOCKED The test could not be run — the application pages required to exercise the flow are unreachable due to DNS resolution failures. Observations: - Direct navigation to the recovery URL (https://pazysalvo-vercel.vercel.app/recuperar) and to the login URL returned DNS_PROBE_FINISHED_NXDOMAIN. - The browser shows the site-level "This site can't be reached" DNS error page with a visible 'Reload' button; multiple reload attempts did not resolve the error.

Cause

The hostname is failing at DNS resolution (NXDOMAIN), which usually means the domain/subdomain is not currently valid or not present in DNS. On the hosting side, this can happen if the Vercel project was removed, renamed, redeployed under a different domain, or the production alias for pazysalvo-vercel.vercel.app is missing/misconfigured. It can also indicate a broader DNS propagation or configuration issue where the domain is no longer resolving to Vercel.

Fix

Verify the Vercel project is still deployed and assigned to the correct production domain. In the Vercel dashboard, check that pazysalvo-vercel.vercel.app exists, is not paused/deleted, and that its DNS/alias configuration is intact. If the app was moved to a custom domain, restore or reassign the expected Vercel subdomain or update the test to the active domain. Also confirm there are no account, project, or deployment issues blocking the app from being published. If using an external DNS record for a custom domain, repair the A/CNAME records and ensure the domain points to Vercel correctly.
